

# VELOCITY DUALLink

Microspace Communications has successfully provided satellite content delivery for business applications for over 25 years.

One of the primary reasons for that success is the high level of service availability that the Microspace solution has historically offered. Our VELOCITY service was designed to provide network availability in excess of 99.99% when measured on an annual basis. That level of availability is one of the key reasons that the Microspace network has grown to over a quarter of a million sites throughout North America. That level of availability is also one of the reasons that mission critical applications in the health, emergency management, disaster recovery, financial and weather information markets just to name a few use the Microspace VELOCITY service each and every day.

## \*Dual Ku Band Uplink Configuration

If network availability is an absolute must for your business you'll be excited to hear about our new DUALLink offering. DUALLink was designed by the Microspace engineering team to increase the already excellent network availability that our VELOCITY service offers. With DUALLink your network's availability could increase by as much as 71 %! *(These are actual results measure in the third quarter of 2014, and charted below.)*

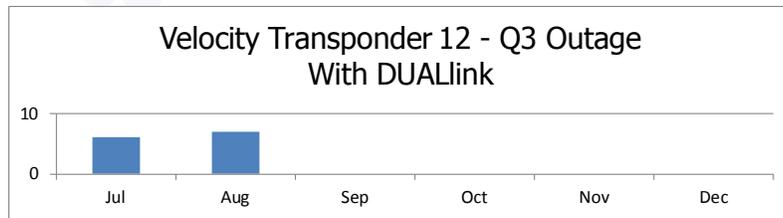

Dual Ku transmit antennas that are geographically separated coupled with seamless signal switching are utilized to provide this significant increase in efficiency. It's ground breaking technology for enterprise business applications and it's available for your network today!

Ask your Microspace Account Manager to share the details.
